

Control-M SaaS Qualification Tool

The Control-M SaaS Qualification Tool scans your self-hosted environment and generates an Excel-based Qualification Report that identifies incompatibility issues and lists the actions you must take—with the guidance of the BMC presales team—to resolve or work around when you migrate to Control-M SaaS. You might have to run this scan more than once to ensure a safe transition of data.

This procedure describes how to obtain and run the Control-M SaaS Qualification Tool.

Before you begin

Ensure that you have Control-M Automation API version 9.0.20.245 or higher installed on the Primary EM.

Note: It is recommended to use the latest AAPI version.

Begin

1. Log in to the account where Control-M/EM is installed with a username that is associated with an Admin role.
2. Download the most up-to-date version of the Control-M SaaS Qualification Tool from the following storage site: https://control-m-conversion.s3.eu-central-1.amazonaws.com/Control-M_Conversions_for_DS/migration-tool.html
3. Unzip the downloaded package to a local folder.
4. Run `SaaSQualificationTool.bat -u control-m-enterprise-manager-username -p control-m-enterprise-manager-password`

The tool runs and reports are generated and saved to the report folder.
